After the introduction of the first Henrico County Web-GIS utilizing Freeance, several county departments asked for customizations of the application to better meet their business practices. Requests included additional themes, changes in symbology, re-ordering of themes and theme groups, and the removal of unneeded themes. Instead of handling these customizations by creating totally new applications, Freeance allowed for the “copying” of an existing Client Application configuration, which could then be modified and deployed as a new application.

This application for our Public Works Department contains several themes specialized for their work, These include a CIP layer, capital project locations, and stream and watershed management areas. As with the main Web-GIS application, users can open linked documents through map anchors configured in Freeance.
